

Shively's new high power broadband on the air in South Dakota

Shively Labs is pleased to announce that our latest 10-bay model 6828 broadband antenna is now on-air in South Dakota. The system includes a 2 channel combing unit giving two 100kW stations access to the shared broadband antenna, side-mounted to a large existing tower. The frequency separation between these stations is almost 10MHz, but the stations report the performance is exceeding initial expectations. Broadband performance of the 6828 allows both stations to enjoy VSWR's well below 1.1:1, and the system has room for additional station growth as well.

For further details about this and other new models being introduced please contact sales@shively.com.
